TECHNICAL SKILLS

- **Frontend:** React, React Native, HTML5, CSS3, JavaScript (ES6+), Bootstrap, Tailwind.
- **Backend:** Node.js, Express, GraphQL, RESTful APIs.
- **Databases:** MongoDB, PostgreSQL.
- **Tools & DevOps:** Git/GitHub, Docker, Linux/Unix CLI, Bash Scripting, Apollo Client, NPM/Yarn.
- **Systems:** Virtualization (Android Emulator/Hypervisor), Hardware Configuration, Network Troubleshooting.

TECHNICAL PROJECTS

Full-Stack Employee Management System | *Node.js, GraphQL, MongoDB, Express*

- Architected a scalable backend for an **Employee Management System**, implementing **GraphQL** to optimize data retrieval and reduce over-fetching.
- Designed a NoSQL database schema in **MongoDB** to efficiently manage complex employee profiles and departmental data.
- Managed version control via **GitHub**, maintaining a clean commit history for collaborative code reviews.

Financial Management Console Application | *C#, .NET*

- Engineered a menu-driven tracker in **C#** focused on robust data validation and user-input processing.
- Applied **Object-Oriented Programming (OOP)** principles to ensure modularity and code reusability across the application.

Infrastructure & Game Server Management | *Linux, Shell Scripting, SteamWorks API*

- Administered and configured a **Project Zomboid** multiplayer server, resolving complex authentication failures (AuthTicketCanceled) and connectivity issues.
- Utilized **Linux CLI** and utilities like **grep** and **tar** to automate file management and analyze server logs for player performance optimization.
- Troubleshooted **Android Studio** development environments, resolving hypervisor driver conflicts to ensure stable mobile emulation.

EDUCATION

Advanced Diploma in Software Engineering Technology | [School Name, e.g., George Brown College] *Expected Graduation: 2026*

- **Relevant Coursework:** Full-Stack Development, Database Management (COMP3133), Linux/Unix Systems, Object-Oriented Programming.

EXPERIENCE / TECHNICAL ACCOMPLISHMENTS

Technical Systems Specialist | *Freelance / Independent Projects*

- **Hardware Architecture:** Built and configured high-performance PC systems (Asus/Deepcool architecture), managing complex cable routing and component installation.
 - **System Stability:** Diagnosed and resolved critical system-level stability errors, including **Kernel-Power Event ID 41**, through advanced power delivery and driver troubleshooting.
 - **OS Optimization:** Managed dual-boot and virtualized environments, ensuring 99% uptime for development-heavy workloads.
-

Why this works for Web Development:

1. **Direct Project Relevance:** Your Employee Management project is the "heavy hitter" here because it uses the exact stack (Node/GraphQL/MongoDB) that many modern web firms are looking for.
2. **Infrastructure Knowledge:** Most junior web developers don't have experience with Linux CLI or server management. Including your work with game servers and log analysis proves you can handle the deployment and maintenance side of web apps.
3. **Hardware/Logic Blend:** Showing that you can troubleshoot a Kernel-Power error *and* write a C# application shows a recruiter that you have a deep, "under-the-hood" understanding of how computers work.
