Re: DevOps

To Cesar Hernandez,

I'm Dominic Frydryk, a student at George Brown College, and I'm writing to apply for the DevOps role. I have built stable environments, automating repetitive tasks, and ensuring that infrastructure is as resilient as the code it supports. I have hands-on experience administering dedicated Linux-based servers by proactively monitoring system health and resolving connectivity bottlenecks before they impact users.

Beyond the technical side, I've always found that the most important part of any system is the people running it. I genuinely enjoy getting to know my teammates and building the kind of trust that makes a workday better for everyone. I bond quickly with others and pride myself on being a clear, approachable communicator. Especially in a fast-paced field like DevOps, I believe that staying grounded and keeping the lines of communication open during high-pressure moments is just as vital as the code itself.

I understand that a DevOps role is about being a bridge. I can understand the language of developers because of my background and with that I can use my knowledge to get more into the automotive aspects of Ops. I can identify exactly which parts of the workflow consume the most time and implement improvements to reclaim that efficiency.

Thank you for your time and for considering my application. I look forward to the opportunity to discuss how my background in systems administration and infrastructure automation can support your operations team.

Best regards,

Dominic Frydryk
